NEOLOAD Testing Steps – Variable User Issues

We ran our scenario and found that the student logins defined in our CSV file are not being used in the load test. Please review the screen captures below. In this case, the scenario was recorded with student user id 208 as a virtual user. There are results for student 208 but not the students in the csv file. It is as if the content of the csv file is not being read. Could there be an issue with recording the scenario with a specific student user ID as a virtual user? Are we missing a critical step in our definition for reading the CSV file?
